

Nelius White Paper

What is Nelius?

Nelius is the execution of an inspiration born from a desire to help programs & events get better publicity and funding.

This innovative approach to supporting events offered by Nelius will be driven by holders of the network's utility token.

Players in Nelius

- Event Owners
- Token Holders

Event Owners

Event Owners are entities that have successfully been admitted by Nelius to receive support.

How Events will be funded:

- All events up for support by Nelius will receive donations from Nelius proportional to their publicity score.

Token Holders

Token holders are entities that have the Nelius utility token either in their cold wallets or hot wallets

Holders of the utility token will:

- Stake a minimum amount of token to cast votes, and events with the highest votes will qualify to receive support from Nelius for a given period.
- Number of votes casted by a token holder will be proportional to the amount of tokens staked.

How Token Holders will be rewarded:

- A fraction of donations to events will go to voters according to the publicity score of events voted for and amount of token staked.

Origin

Nelius came about as a response to a desire to assist church programs and events get better publicity but it was soon discovered that events and programs everywhere sometimes face similar challenges and can benefit from the innovative approach of Nelius.

Road Map

Nelius will be a fully decentralized network, but the roadmap to full decentralization will be gradual. In about 2-3years starting 2025, the network should be completely decentralized and events from every sphere of human socialization and endeavour will be able to craft innovative ways to use Nelius.

However, due to the origins of Nelius, the network will actively focus on helping the church

community with event publicity and funding (although other events might find their way to the Nelius support bracket from time to time)

Nelius Utility Token

The utility token of the Nelius network is a donation token and should be treated as such. 1/10th of every transaction made with the token will be transferred to a wallet which will be quickly exchanged for digital currencies like Bitcoin and deposited in the wallet addresses of early Nelius adopters. This will set-up early adopters and supporters of Nelius for life [in future updates to this white paper, how to get into this specific reward system despite joining the network late will be given]

As the Nelius network grows and until it becomes fully decentralized, this white paper will be updated (not modified) with recent developments.
